Page 4. Work related stress

Stress inside and outside the workplace.

It is necessary to reconsider the tools to identify work related stress. The current methodology raises some confusion. This article is based on a wider and in-depth speech held at a recent seminar organized by Turin Medical Council on “Epigenetic, Pnei and Health: legal implications”.

Mirko La Bella

Page 8. Stress and time

Individual perception of the past, present and future.

A recent approach, Time Perspective, analyzes the psychological attitude that all individuals have towards time. It identifies the specific time perspective that affects our style of life and thus also the biological effectiveness in managing stress.

Page 13. The basis of intelligence.

Two points of view on the importance of genes and environment. Since decades the genetic basis of intelligence is the topic of an intense debate: heredity versus environment.

On one side, there is the role of the genome seen as a determining factor in the development of intelligence. On the other side, the importance of the role played by family, education and the social and cultural environment.
