

The European Medicines Agency had to admit that Astrazeneca Covid-19 vaccine may present rare serious adverse thromboembolic events that may result with the vaccinated patient's death. It neglected although to draw any subsequent conclusion and referred the matter to the single States. Avoiding to decide on a considerably important health issue is indeed a despicable behaviour from the scientific and technical committee of the European Union whose assignment is to authorize and control medicines. I do not have a pale idea of how much this institution costs to the European citizens, but I imagine it is not little. This behaviour is disqualifying and it gives the idea of a non-existent European Union, the same Union that is ridiculed by a little dictator and the disloyal Michel. It is indecent on the scientific level because, after having identified a very serious risk for the persons who receive the Astrazeneca vaccine, EMA does not provide any indication to avoid the risks as far as possible, and reassure the citizens. The only indications provided by EMA were given after the events.

It is recommended to the vaccinated patients and the treating physicians to watch some symptoms that may arise within 2 weeks following the vaccination: shortness of breath, chest pain, persistent abdominal pain, neurological symptoms such as persistent headache, blurred vision, skin rashes or tiny blood spots under the skin beyond the site of injection. The healthcare professionals should evaluate and investigate if these symptoms indicate a blood clotting alteration and thus act accordingly. That is all. These are the indications. This means zero risk prevention. Those who follow our work, know already how we have pointed out several times the importance to prevent the risks by carrying out a serious examination, knowing the clinical history of the patient to be vaccinated and performing routine analysis that can be thorough in case the individual has a familiarity or other risk factors to blood clotting alteration. In other words: by implementing scientific medicine. The measures taken by Draghi Government go in the opposite direction to what exposed above as they recommend the Astrazeneca vaccine for the individuals over 60. Recommending? After EMA also our government acts as Pontius Pilate. This avoidance of all responsibilities is ridiculous since it does not bear any value speculating that the thromboembolic events occur only in young people. According to the French government population over 55 should not worry, for the Italian government the over 60 individuals should not be concerned, for the British government the over 30 should not be feeling uneasy. How unfortunate it is for science to have fallen into such hands!
